Car Seat Slide Pad

Description:

The Car Seat Slide Pad is designed to aid people getting in and out of the front car seat. It consists of two components – a bottom pad and a top pad. The Car Seat Slide Pad can be used for independent and assisted transfers.

Handles on either side of the upper pad aid the patient (or carer) in swiveling into the car with ease.

The Car Seat Slide Pad is machine washable in warm water (50-60°C). Cool tumble dry. Do not use chlorine bleaches, harsh chemical or fabric softeners.

Dimensions:

Length 44cm
Width 48cm

Instructions for use:

Attach the bottom pad to the car seat with the three sets of straps attached, ensuring the buckles are fastened under the seat. The underside of the pad is made from a non-slip material, and the upper side is slippery. The upper pad is placed on top of the bottom pad.

To enter the car, swivel the top pad 90° so that it faces the door. The passenger then places their bottom on the pad and slides back into the middle of the seat. The passenger then grips the handles on the pad before lifting both legs together into the car and swiveling to face the front. A carer may be required to assist with this action.

Once the patient is comfortable, secure the webbing strap buckle attached to the upper pad behind the car seat and fasten seatbelt.
